Preface

This reference covers OpenIG configuration.

1 Who Should Use this Reference

This reference is written for access management designers, developers, and administrators using OpenIG. For API specifications, see the appropriate Javadoc.

2 Formatting Conventions

Most examples in the documentation are created on GNU/Linux or Mac OS X. Where it is helpful to make a distinction between operating environments, examples for UNIX, GNU/Linux, Mac OS X, and so forth are labeled (UNIX). Mac OS X specific examples can be labeled (Mac OS X). Examples for Microsoft Windows can be labeled (Windows). To avoid repetition, however, file system directory names are often given only in UNIX format as in `/path/to/server`, even if the text applies to `C:\path\to\server` as well.

Absolute path names usually begin with the placeholder `/path/to/`. This path might translate to `/opt/`, `C:\Program Files\`, or somewhere else on your system.

Command line, terminal sessions are formatted as follows.

```
$ echo $JAVA_HOME
/path/to/jdk
```

Command output is sometimes formatted for narrower, more readable output even though formatting parameters are not shown in the command. In the following example, the query string parameter `_prettyPrint=true` is omitted.

```
$ curl https://bjensen:hifalutin@opendj.example.com:8443/users/newuser
{
  "_rev" : "000000005b337348",
  "schemas" : [ "urn:scim:schemas:core:1.0" ],
  "contactInformation" : {
    "telephoneNumber" : "+1 408 555 1212",
    "emailAddress" : "newuser@example.com"
  },
  "_id" : "newuser",
  "name" : {
    "familyName" : "New",
    "givenName" : "User"
  },
  "userName" : "newuser@example.com",
  "displayName" : "New User",
  "meta" : {
    "created" : "2014-06-03T09:58:27Z"
  },
  "manager" : [ {
    "_id" : "kvaughan",
    "displayName" : "Kirsten Vaughan"
  } ]
}
```

Program listings are formatted as follows.

```
class Test {
    public static void main(String [] args) {
        System.out.println(This is a program listing.);
    }
}
```

3 Accessing Documentation Online

ForgeRock core documentation, such as what you are now reading, aims to be technically accurate and complete with respect to the software documented.

Core documentation therefore follows a three-phase review process designed to eliminate errors.

- Product managers and software architects review project documentation design with respect to the users' software lifecycle needs.
- Subject matter experts review proposed documentation changes for technical accuracy and completeness with respect to the corresponding software.

- Quality experts validate implemented documentation changes for technical validity with respect to the software, technical completeness with respect to the scope of the document, and usability for the expected audience.

The review process helps to ensure that documentation published for a ForgeRock release is technically accurate and complete.

Fully reviewed, published core documentation is available at <http://docs.forgerock.org/>. Use this documentation when working with a ForgeRock Enterprise release.

In-progress documentation can be found at each project site under the [Developer Community](#) projects page. Use this documentation when trying a nightly build.

The ForgeRock [Community Wikis](#) and provide additional, user-created information. We encourage you to [join the community](#), so that you can update the Wikis, too.

4 Joining the ForgeRock Community

After you [sign up](#) to join the ForgeRock community, you can edit the [Community Wikis](#), and also log bugs and feature requests in the [issue tracker](#).

If you have a question regarding a project but cannot find an answer in the project documentation or Wiki, browse to the [Developer Community](#) page for the project, where you can find details on joining the project mailing lists, and find links to mailing list archives. You can also suggest updates to documentation through the [ForgeRock docs mailing list](#).

The Community Wikis describe how to check out and build source code. Should you want to contribute a patch, test, or feature, or want to author part of the core documentation, first have a look on the ForgeRock site at [how to get involved](#).

Required Configuration

You must specify at least the entry point for incoming requests, the OpenIG Servlet, and the heap objects that configure and initialize objects, with dependency injection.

Table of Contents

Gateway Servlet	11
Heap Objects	13

Gateway Servlet

Gateway Servlet — entry point for all incoming requests

1 Description

The gateway servlet is the entry point for all incoming requests. It is responsible for initializing a [heap of objects](#), and dispatching all requests to a configured servlet (which is itself a heap object). The configuration of the gateway servlet is loaded from a JSON-encoded configuration file, typically located at `~/.ForgeRock/OpenIG/config.json`.

2 Usage

```
{
  "heap": { heap-configuration object },
  "servletObject": string
}
```

3 Properties

"heap": *object, required*

The [heap object](#) configuration.

"servletObject": *string, required*

The name of the servlet heap object to dispatch all requests to.

4 Javadoc

[org.forgerock.openig.gateway.GatewayServlet](#)

Heap Objects

Heap Objects — configure and initialize objects, with dependency injection

1 Description

A heap is a collection of associated objects, initialized from declarative configuration artifacts. All configurable objects in the gateway are heap objects. Heap objects are created and initialized by associated "heaplets", which retrieve any objects an object depends on from the heap. The heap configuration is included as an object in the [gateway servlet](#) configuration, and has the following format.

2 Usage

```
{
  "objects": [
    {
      "name": string,
      "type": string,
      "config": { object-specific configuration }
    }, ...
  ]
}
```

3 Properties

"name": *string, required*

The unique name to give the heap object in the heap. This name is used to resolve the heap object, for example when another heap object names a heap object dependency.

"type": *string, required*

The class name of the object to be created. Example: "HandlerServlet". To determine the type name, see the specific object documentation in this reference.

"config": *object, required*

The configuration that is specific to the heap object being created. For an example, see the [HandlerServlet](#) reference.

4 Automatically Created Objects

When a heap is first created, it is automatically populated with some objects, without required configuration. An automatically created object can be overridden by creating a heap object with the same name.

"LogSink"

The default object to use for writing all audit and performance logging.
Default: a [ConsoleLogSink](#) object with default values.

"TemporaryStorage"

The default object to use for managing temporary buffers. Default: a [TemporaryStorage](#) object with default values.

5 Implicit Properties

Every heap object has a set of implicit properties, which can be overridden on an object-by-object basis:

"logSink": *string*

Specifies the heap object that should be used for audit and performance logging. Default: "LogSink".

"temporaryStorage": *string*

Specifies the heap object that should be used for temporary buffer storage. Default: "TemporaryStorage".

Servlets

The gateway includes objects that can create, initialize and dispatch to Java Enterprise Edition Servlets and Servlet filters.

Table of Contents

DispatchServlet	17
HandlerServlet	19
HttpServlet	21
ServletFilter	23

DispatchServlet

DispatchServlet — dispatch request based on extra path information

1 Description

Dispatches requests to mapped filters and servlets based on request's extra path information. The extra path information is the path that follows the path of the dispatch servlet itself, but precedes the query string. It is guaranteed to be a value that always begins with a "/" character.

All filters that match the pattern are invoked in the order they are expressed in the "bindings" list until a matching servlet is encountered. The first matching servlet object in the bindings list is invoked, and terminates any further processing of the request. If no matching servlet is found, an exception is thrown. To avoid this, a final "catch-all" servlet binding with a pattern of ".*" is recommended.

2 Usage

```
{
  "name": string,
  "type": "DispatchServlet",
  "config": {
    "bindings": [
      {
        "pattern": pattern,
        "object": string,
      }, ...
    ]
  }
}
```

3 Properties

"bindings": *array of objects, required*

A list of bindings of patterns and associated servlets/filters to dispatch to.

"pattern": *pattern, required*

The regular expression pattern to match against the incoming request extra path information.

"object": *string, required*

The name of the HTTP servlet or servlet filter heap object to dispatch to if the regular expression pattern matches.

4 Example

Sample from a federation configuration. Federation is implemented as its own servlet which will be dispatched to based on the incoming URI starting with `/saml`. All other requests will go through the `HandlerServlet`.

```
{
  "name": "Dispatcher",
  "type": "DispatchServlet",
  "config": {
    "bindings": [
      {
        "pattern": "^/saml",
        "object": "FederationServlet"
      },
      {
        "pattern": ".*",
        "object": "HandlerServlet"
      }
    ]
  }
}
```

5 Javadoc

[org.forgerock.openig.servlet.DispatchServlet](#)

HandlerServlet

HandlerServlet — translate and marshal request to a handler

1 Description

Services a servlet request by translating it and marshaling to a handler.

2 Usage

```
{
  "name": string,
  "type": "HandlerServlet",
  "config": {
    "handler": string,
    "baseURI": string
  }
}
```

3 Properties

"handler": *string, required*

The name of the handler heap object to dispatch the exchange to.

"baseURI": *string, optional*

Overrides request URLs constructed by container, making requests relative to a new base URI. Only scheme, host and port are used in the supplied URI. Default: use container URL.

4 Javadoc

[org.forgerock.openig.servlet.HandlerServlet](#)

HttpServlet

HttpServlet — create stock servlet in heap environment

1 Description

Creates and initializes a stock servlet in a heap environment.

2 Usage

```
{
  "name": string,
  "type": "javax.servlet.http.HttpServlet",
  "config": {
    "initParams": {
      name: string, ...
    }
  }
}
```

3 Properties

"initParams": *object of name-value pairs*

Initialization parameters to supply to servlet. The name is a string containing the name of the initialization parameter.

4 Javadoc

[org.forgerock.openig.servlet.HttpServletHeaplet](#)

ServletFilter

ServletFilter — create stock servlet filter in heap environment

1 Description

Creates and initializes a stock servlet filter in a heap environment.

2 Usage

```
{
  "name": string,
  "type": "javax.servlet.Filter",
  "config": {
    "initParams": {
      name: string, ...
    }
  }
}
```

3 Properties

"initParams": *object of name-value pairs*

Initialization parameters to supply to servlet filter. The name is a string containing the name of the initialization parameter.

4 Javadoc

[org.forgerock.openig.servlet.ServletFilterHeaplet](#)

Handlers

Handler objects process an HTTP exchange request by producing an associated response.

Table of Contents

Chain	27
ClientHandler	29
DispatchHandler	31
SequenceHandler	33
StaticResponseHandler	35

Chain

Chain — dispatch exchange to ordered list of filters

1 Description

A chain is responsible for dispatching an exchange to an ordered list of filters, and finally a handler.

2 Usage

```
{
  "name": string,
  "type": "Chain",
  "config": {
    "filters": [ string, ... ],
    "handler": string
  }
}
```

3 Properties

"filters": *array of strings, required*

The names of the filter heap objects to dispatch the exchange to, in order.

"handler": *string, required*

The name of the handler object to dispatch to once the exchange has traversed all of the specified filters.

4 Example

```
{
  "name": "LoginChain",
  "type": "Chain",
  "config": {
    "filters": [ "LoginFilter" ],
    "handler": "ClientHandler"
  }
}
```

5 Javadoc

[org.forgerock.openig.filter.Chain](#)

ClientHandler

ClientHandler — submit exchange requests to remote servers

1 Description

Submits exchange requests to remote servers.

Note

This handler does not verify hostnames for outgoing SSL connections. This is because the gateway usually accesses the SSL endpoint using a raw IP address rather than a fully-qualified hostname.

2 Usage

```
{
  "name": string,
  "type": "ClientHandler",
  "config": {
    "connections": number
  }
}
```

3 Properties

"connections": *number, optional*

The maximum number of concurrent connections to open. Default: 64

4 Javadoc

[org.forgerock.openig.handler.ClientHandler](#)

DispatcherHandler

DispatcherHandler — dispatch to one of a list of handlers

1 Description

Dispatches to one of a list of handlers. When an exchange is handled, each handler's condition is evaluated. If a condition expression yields true, then the exchange is dispatched to the associated handler with no further processing.

2 Usage

```
{
  "name": string,
  "type": "DispatcherHandler",
  "config": {
    "bindings": [
      {
        "condition": expression,
        "handler": string,
        "baseURI": string,
      }, ...
    ]
  }
}
```

3 Properties

"bindings": *array of objects, required*

A list of bindings of conditions and associated handlers to dispatch to.

"condition": *expression, optional*

Condition to evaluate to determine if associated handler should be dispatched to. If omitted, then dispatch is unconditional.

"handler": *string, required*

The name of the handler heap object to dispatch to if the associated condition yields true.

"baseURI": *string, optional*

Overrides the existing request URI, making requests relative to a new base URI. Only scheme, host and port are used in the supplied URI. Default: leave URI untouched.

4 Example

```
{
  "name": "Dispatcher",
```

```
    "type": "DispatchHandler",
    "config": {
      "bindings": [
        {
          "condition": "${exchange.request.uri.path == '/login.php'}",
          "handler": "LoginChain",
        },
        {
          "condition": "${exchange.request.uri.path == '/logout.php'}",
          "handler": "LogoutChain",
        },
        {
          "handler": "ClientHandler",
        }
      ]
    }
  }
}
```

5 Javadoc

[org.forgerock.openig.handler.DispatchHandler](#)

SequenceHandler

SequenceHandler — process exchange through sequence of handlers

1 Description

Processes an exchange through a sequence of handlers. This allows multi-request processing such as retrieving a form, extracting form content (for example, nonce) and submitting in a subsequent request. Each handler in the bindings is dispatched to in order; the binding postcondition determines if the sequence should continue.

2 Usage

```
{
  "name": string,
  "type": "SequenceHandler",
  "config": {
    "bindings": [
      {
        "handler": string,
        "postcondition": expression
      }
    ]
  }
}
```

3 Properties

"bindings": *array of objects, required*

A list of bindings of handler and postcondition to determine that sequence continues.

"handler": *string, required*

The name of the handler heap object to dispatch to.

"postcondition": *expression, optional*

Evaluated to determine if the sequence continues. Default: unconditional.

4 Javadoc

[org.forgerock.openig.handler.SequenceHandler](#)

StaticResponseHandler

StaticResponseHandler — create static response in HTTP exchange

1 Description

Creates a static response in an HTTP exchange.

2 Usage

```
{
  "name": string,
  "type": "StaticResponseHandler",
  "config": {
    "status": number,
    "reason": string,
    "version": string,
    "headers": {
      name: [ expression, ... ], ...
    },
    "entity": string
  }
}
```

3 Properties

"status": *number, required*

The response status code (for example, 200).

"reason": *string, optional*

The response status reason (for example, "OK").

"version": *string, optional*

Protocol version. Default: "HTTP/1.1".

"headers": *array of objects, required*

Header fields to set in the response. The name specifies the header name, with an associated array of expressions to evaluate as values.

"entity": *string, optional*

The message entity to write in the response. Conforms to the set Content-Type header and sets Content-Length.

4 Example

```
{
  "name": "ErrorHandler",
  "type": "StaticResponseHandler",
  "config": {
```

```
    "status": 500,  
    "reason": "Error",  
    "entity": "<html><h2>Epic #FAIL</h2></html>"  
  }  
}
```

5 Javadoc

[org.forgerock.openig.handler.StaticResponseHandler](#)

Filters

Filter objects perform filtering of the request and response of an HTTP exchange.

Table of Contents

AssignmentFilter	39
CaptureFilter	41
CookieFilter	43
EntityExtractFilter	45
ExceptionHandler	47
FileAttributesFilter	49
HeaderFilter	51
CryptoHeaderFilter	53
HttpBasicAuthFilter	55
SqlAttributesFilter	57
StaticRequestFilter	59
SwitchFilter	61

AssignmentFilter

AssignmentFilter — conditionally assign values to expressions

1 Description

Conditionally assigns values to expressions before and after the exchange is handled.

2 Usage

```
{
  "name": string,
  "type": "AssignmentFilter",
  "config": {
    "onRequest": [
      {
        "condition": expression,
        "target": lvalue-expression,
        "value": expression
      }, ...
    ],
    "onResponse": [
      {
        "condition": expression,
        "target": lvalue-expression,
        "value": expression
      }, ...
    ]
  }
}
```

3 Properties

"onRequest": *array of objects, optional*

Defines a list of assignment bindings to evaluate before the exchange is handled.

"onResponse": *array of objects, optional*

Defines a list of assignment bindings to evaluate after the exchange is handled.

"condition": *expression, optional*

Expression to evaluate to determine if an assignment should occur. Omitting the condition makes the assignment unconditional.

"target": *lvalue-expression, required*

Expression that yields the target object whose value is to be set.

"value": *expression, optional*

Expression that yields the value to be set in the target.

4 Example

This is an example of how you would capture credentials and store them in the Gateway session during a login request. Notice the credentials are captured on the request, but not marked as valid until the response returns a positive 302. The credentials would then be used to login a user to a different application.

```
{
  "name": "PortalLoginCaptureFilter",
  "type": "AssignmentFilter",
  "config": {
    "onRequest": [
      {
        "target": "${exchange.session.authUsername}",
        "value": "${exchange.request.form['username']}[0]}",
      },
      {
        "target": "${exchange.session.authPassword}",
        "value": "${exchange.request.form['password']}[0]}",
      },
      {
        "comment": "Indicates authentication has not yet been confirmed.",
        "target": "${exchange.session.authConfirmed}",
        "value": "${false}",
      }
    ],
    "onResponse": [
      {
        "condition": "${exchange.response.status == 302}",
        "target": "${exchange.session.authConfirmed}",
        "value": "${true}",
      }
    ]
  }
}
```

5 Javadoc

[org.forgerock.openig.filter.AssignmentFilter](#)

CaptureFilter

CaptureFilter — capture request and response messages

1 Description

Captures request and response messages for further analysis.

2 Usage

```
{
  "name": string,
  "type": "CaptureFilter",
  "config": {
    "file": string,
    "charset": string,
    "condition": expression,
    "captureEntity": boolean
  }
}
```

3 Properties

"file": *string, required*

The path of the file where captured output should be written.

"charset": *string, optional*

The character set to encode captured output with. Default: "UTF-8".

"condition": *expression, optional*

The condition to evaluate to determine whether to capture an exchange.
Default: unconditional.

"captureEntity": *boolean, optional*

Indicates that message entity should be captured. Default: true.

4 Examples

Log the entire request and response:

```
{
  "name": "LogToTemporaryFile",
  "type": "CaptureFilter",
  "config": {
    "file": "/tmp/gateway.log",
  }
}
```

Log the request and response. Do not log the entity:

```
{
  "name": "LogToTemporaryFile",
  "type": "CaptureFilter",
  "config": {
    "file": "/tmp/gateway.log"
    "captureEntity": false,
  }
}
```

Normal usage of the CaptureFilter is to create an OutgoingChain. This enables you to call filters like the CaptureFilter, before sending out the request:

```
{
  "name": "OutgoingChain",
  "type": "Chain",
  "config": {
    "filters": [ "LogToTemporaryFile" ],
    "handler": "ClientHandler"
  }
},
{

  "type": "CaptureFilter",
  "config": {
    "captureEntity": false,
    "file": "/tmp/gateway.log",
  }
}
```

5 Javadoc

[org.forgerock.openig.filter.CaptureFilter](#)

CookieFilter

CookieFilter — manage, suppress, relay cookies

1 Description

Manages, suppresses and relays cookies. Managed cookies are intercepted by the cookie filter itself and stored in the gateway session; managed cookies are not transmitted to the user agent. Suppressed cookies are removed from both request and response. Relayed cookies are transmitted freely between user agent and remote server and vice-versa.

If a cookie does not appear in one of the three action parameters, then the default action is performed, controlled by setting the `defaultAction` parameter. If unspecified, the default action is to manage all cookies. In the event a cookie appears in more than one configuration parameter, then it will be selected in the order of precedence: managed, suppressed, relayed.

2 Usage

```
{
  "name": string,
  "type": "CookieFilter",
  "config": {
    "managed": [ string, ... ],
    "suppressed": [ string, ... ],
    "relayed": [ string, ... ],
    "defaultAction": string
  }
}
```

3 Properties

`"managed"`: *array of strings, optional*

A list of the names of cookies to be managed.

`"suppressed"`: *array of strings, optional*

A list of the names of cookies to be suppressed.

`"relayed"`: *array of strings, optional*

A list of the names of cookies to be relayed.

`"defaultAction"`: *string, optional*

Action to perform for cookies that do not match an action set. Must be one of: "MANAGE", "RELAY", "SUPPRESS". Default: "MANAGE".

EntityExtractFilter

EntityExtractFilter — extract pattern from message entity

1 Description

Extracts regular expression patterns from a message entity. The extraction results are stored in a target object. For a given matched [pattern](#), the value stored in the object is either the result of applying its associated pattern template (if specified) or the match result itself otherwise.

2 Usage

```
{
  "name": string,
  "type": "EntityExtractFilter",
  "config": {
    "messageType": string,
    "charset": string,
    "target": lvalue-expression,
    "bindings": [
      {
        "key": string,
        "pattern": regex-pattern,
        "template": pattern-template
      }, ...
    ]
  }
}
```

3 Properties

"messageType": *string, required*

The message type in the exchange to extract patterns from. Must be one of: "REQUEST", "RESPONSE".

"charset": *string, optional*

Overrides the character set encoding specified in message. Default: the message encoding is used.

"target": *lvalue-expression, required*

Expression that yields the target object that contains the extraction results.

"key": *string, required*

Name of element in target object to contain an extraction result.

"pattern": *pattern, required*

The regular expression pattern to find in the entity.

"template": [pattern-template](#), optional

The template to apply to the pattern and store in the named target element.
Default: store the match result itself.

4 Examples

Extracts a nonce from the response, which is typically a login page, and sets its value in the exchange to be used by the downstream filter posting the login form. The nonce value would be accessed using the following expression `${exchange.wikiNonce.wpLoginToken}`. The pattern is finding all matches in the HTTP body of the form `wpLogintoken value="abc"`. Setting the template to `$1` assigns the value `abc` to `exchange.wikiNonce.wpLoginToken`:

```
{
  "name": "WikiNoncePageExtract",
  "type": "EntityExtractFilter",
  "config": {
    "messageType": "response",
    "target": "${exchange.wikiNonce}",
    "bindings": [
      {
        "key": "wpLoginToken",
        "pattern": "wpLoginToken|\"|s.*value=\\(\\.*)\\\"",
        "template": "$1"
      }
    ]
  }
}
```

Reads the response looking for the OpenAM login page. When found it sets `loginPage.found = true` to be used in a `SwitchFilter` to post the login credentials:

```
{
  "name": "FindLoginPage",
  "type": "EntityExtractFilter",
  "config": {
    "messageType": "response",
    "target": "${exchange.isLoginPage}",
    "bindings": [
      {
        "key": "found",
        "pattern": "OpenAM\\s\\(Login\\)",
        "template": "true"
      }
    ]
  }
}
```

5 Javadoc

[org.forgerock.openig.filter.EntityExtractFilter](#)

ExceptionHandler

ExceptionHandler — catch exceptions when handling request

1 Description

Catches any exceptions thrown during handling of a request. This allows friendlier error pages to be displayed than would otherwise be displayed by the container. Caught exceptions are logged with a log level of `WARNING` and the exchange is diverted to the specified exception handler.

2 Usage

```
{
  "name": string,
  "type": "ExceptionHandler",
  "config": {
    "handler": string,
  }
}
```

3 Properties

"handler": *string, required*

The name of the handler heap object to dispatch to in the event of caught exceptions.

4 Javadoc

[org.forgerock.openig.filter.ExceptionFilter](#)

FileAttributesFilter

FileAttributesFilter — retrieve record from a file

1 Description

Retrieves and exposes a record from a delimiter-separated file. Lookup of the record is performed using a specified key, whose value is derived from an exchange-scoped expression. The resulting record is exposed in an object whose location is specified by the target expression. If a matching record cannot be found, then the resulting object is empty.

The retrieval of the record is performed lazily; it does not occur until the first attempt to access a value in the target. This defers the overhead of file operations and text processing until a value is first required. This also means that the value expression is not evaluated until the object is first accessed.

2 Usage

```
{
  "name": string,
  "type": "FileAttributesFilter",
  "config": {
    "file": string,
    "charset": string,
    "separator": string,
    "header": boolean,
    "fields": [ string, ... ],
    "target": lvalue-expression,
    "key": string,
    "value": expression
  }
}
```

3 Properties

"file": *string, required*

The file containing the record to be read.

"charset": *string, optional*

The character set the file is encoded in. Default: "UTF-8".

"header": *boolean, optional*

Indicates the first line of the file contains the set of defined field keys.
Default: true.

"fields": *array of strings, optional*

Explicit field keys in the order they appear in a record, overriding any existing field header. Default: use field header.

"target": *lvalue-expression, required*

Expression that yields the target object that will contain the record.

"key": *string, required*

The name of the field in the file to perform the lookup on.

"value": *expression, required*

The name of the handler heap object to dispatch to in the event of caught exceptions.

4

Javadoc

[org.forgerock.openig.filter.FileAttributesFilter](#)

HeaderFilter

HeaderFilter — remove and add headers

1 Description

Removes headers from and adds headers to a message. Headers are added to any existing headers in the message. To replace, remove the header and add it.

2 Usage

```
{
  "name": string,
  "type": "HeaderFilter",
  "config": {
    "messageType": string,
    "remove": [ string, ... ],
    "add": {
      name: [ string, ... ], ...
    }
  }
}
```

3 Properties

"messageType": *string, required*

Indicates the type of message in the exchange to filter headers for. Must be one of: "REQUEST", "RESPONSE".

"remove": *array of strings, optional*

The names of header fields to remove from the message.

"add": *object, optional*

Header fields to add to the message. The name specifies the header name, with an associated array of string values.

4 Examples

Replace the host header on the incoming request with myhost.com:

```
{
  "name": "ReplaceHostFilter",
  "type": "HeaderFilter",
  "config": {
    "messageType": "REQUEST",
    "remove": [ "host" ],
    "add": {
      "host": [ "myhost.com" ]
    }
  }
}
```

```
}
```

Add a Set-Cookie header in the response:

```
{
  "name": "SetCookieFilter",
  "type": "HeaderFilter",
  "config": {
    "messageType": "RESPONSE",
    "add": {
      "Set-Cookie": [ "mysession=12345" ]
    }
  }
}
```

Add headers custom1 and custom2 to the request:

```
{
  "name": "SetCustomHeaders",
  "type": "HeaderFilter",
  "config": {
    "messageType": "REQUEST",
    "add": {
      "custom1": [ "12345", "6789" ],
      "custom2": [ "abcd" ]
    }
  }
}
```

5 Javadoc

[org.forgerock.openig.filter.HeaderFilter](#)

CryptoHeaderFilter

CryptoHeaderFilter — encrypt, decrypt headers

1 Description

Encrypts or decrypts headers in a request or response.

2 Usage

```
{
  "name": string,
  "type": "CryptoHeaderFilter",
  "config": {
    "messageType": string,
    "operation": string,
    "algorithm": string,
    "key": string,
    "keyType": string,
    "headers": [ string, ... ]
  }
}
```

3 Properties

"messageType": *string, required*

Indicates the type of message in the exchange to encrypt or decrypt headers, form parameters or cookies. Must be one of: "REQUEST", "RESPONSE".

"operation": *string, required*

Indicates whether to encrypt or decrypt. Must be one of: "ENCRYPT", "DECRYPT".

"algorithm": *string, required*

Algorithm used for encryption and decryption. Defaults to DES/ECB/NoPadding.

"key": *string, required*

Base64 encoded key value.

"headers": *array of strings, optional*

The names of header fields to encrypt or decrypt.

4 Example

```
{
  "name": "DecryptReplayPasswordFilter",
  "type": "CryptoHeaderFilter",
  "config": {
```

```
"messageType": "REQUEST",  
"operation": "DECRYPT",  
"algorithm": "DES/ECB/NoPadding",  
"keyType": "DES",  
"key": "oqdP3DJdE1Q=",  
"headers": [ "replaypassword" ]  
}
```

5 Javadoc

[org.forgerock.openig.filter.CryptoHeaderFilter](#)

HttpBasicAuthFilter

HttpBasicAuthFilter — perform HTTP Basic authentication

1 Description

Performs authentication through the HTTP Basic authentication scheme. For more information, see [RFC 2617](#).

If challenged for authentication via a 401 Unauthorized status code by the server, this filter retries the request with credentials attached. Once an HTTP authentication challenge is issued from the remote server, all subsequent requests to that remote server that pass through the filter includes the user credentials.

If authentication fails (including the case of no credentials yielded from expressions), then the exchange is diverted to the specified authentication failure handler.

2 Usage

```
{
  "name": string,
  "type": "HttpBasicAuthFilter",
  "config": {
    "username": expression,
    "password": expression,
    "failureHandler": string
  }
}
```

3 Properties

"username": *expression, required*

Expression that yields the username to supply during authentication.

"password": *expression, required*

Expression that yields the password to supply during authentication.

"failureHandler": *string, required*

The name of the handler heap object to dispatch to if authentication fails.

4 Example

```
{
  "name": "TomcatAuthenticator",
  "type": "HttpBasicAuthFilter",
  "config": {
```

```
        "username": "tomcat",  
        "password": "tomcat",  
        "failureHandler": "TomcatAuthFailureHandler"  
    }  
}
```

5 Javadoc

[org.forgerock.openig.filter.HttpBasicAuthFilter](#)

SqlAttributesFilter

SqlAttributesFilter — execute SQL query

1 Description

Executes a SQL query through a prepared statement and exposes its first result. Parameters in the prepared statement are derived from exchange-scoped expressions. The query result is exposed in an object whose location is specified by the target expression. If the query yields no result, then the resulting object is empty.

The execution of the query is performed lazily; it does not occur until the first attempt to access a value in the target. This defers the overhead of connection pool, network and database query processing until a value is first required. This also means that the parameters expressions is not evaluated until the object is first accessed.

2 Usage

```
{
  "name": string,
  "type": "SqlAttributesFilter",
  "config": {
    "dataSource": string,
    "preparedStatement": string,
    "parameters": [ expression, ... ],
    "target": lvalue-expression
  }
}
```

3 Properties

"dataSource": *string, required*

The JNDI name of the factory for connections to the physical data source.

"preparedStatement": *string, required*

The parameterized SQL query to execute, with ? parameter placeholders.

"parameters": *array of expressions, required*

The parameters to evaluate and include in the execution of the prepared statement.

"target": *lvalue-expression, required*

Expression that yields the target object that will contain the query results.

4 Example

Using the users sessionid from a cookie, query the database to find the user logged in and set the profile attributes in the exchange:

```
{
  "name": "SqlAttributesFilter",
  "type": "SqlAttributesFilter",
  "config": {
    "target": "${exchange.sql}",
    "dataSource": "java:comp/env/jdbc/mysql",
    "preparedStatement": "SELECT f.value AS 'first', l.value AS
      'last', u.mail AS 'email', GROUP_CONCAT(CAST(r.rid AS CHAR)) AS
      'roles'
      FROM sessions s
      INNER JOIN users u
      ON ( u.uid = s.uid AND u.status = 1 )
      LEFT OUTER JOIN profile_values f
      ON ( f.uid = u.uid AND f.fid = 1 )
      LEFT OUTER JOIN profile_values l
      ON ( l.uid = u.uid AND l.fid = 2 )
      LEFT OUTER JOIN users_roles r
      ON ( r.uid = u.uid )
      WHERE (s.sid = ? AND s.uid <> 0) GROUP BY s.sid;",
    "parameters": [ "${exchange.request.cookies
      [keyMatch(exchange.request.cookies, 'JSESSION1234')]}
      [0].value}" ]
  }
}
```

Lines are folded for readability in this example. In your JSON, keep the values for "preparedStatement" and "parameters" on one line.

5 Javadoc

org.forgerock.openig.filter.SqlAttributesFilter

StaticRequestFilter

StaticRequestFilter — create new request within exchange object

1 Description

Creates a new request within the exchange object. It replaces any request that may already be present in the exchange. The request can include a form, specified in the `form` parameter, which is included in an entity encoded in application/x-www-form-urlencoded format if request method is POST, or otherwise as (additional) query parameters in the URI.

2 Usage

```
{
  "name": string,
  "type": "StaticRequestFilter",
  "config": {
    "method": string,
    "uri": string,
    "version": string,
    "headers": {
      name: [ expression, ... ], ...
    },
    "form": {
      field: [ expression, ... ], ...
    }
  }
}
```

3 Properties

`"method"`: *string, required*

The HTTP method to be performed on the resource (for example, "GET").

`"uri"`: *string, required*

The fully-qualified URI of the resource to access (for example, "http://www.example.com/resource.txt").

`"version"`: *string, optional*

Protocol version. Default: "HTTP/1.1".

`"headers"`: *array of objects, required*

Header fields to set in the request. The name specifies the header name, with an associated array of expressions to evaluate as values.

`"form"`: *array of objects, required*

A form to include in the request. The field specifies the field name, with an associated array of expressions to evaluate as values.

4 Example

```
{
  "name": "LoginRequestFilter",
  "type": "StaticRequestFilter",
  "config": {
    "method": "POST",
    "uri": "http://10.10.0.2:8080/wp-login.php",
    "form": {
      "log": [ "george" ],
      "pwd": [ "bosco" ],
      "rememberme": [ "forever" ],
      "redirect_to": [ "http://portal.example.com:8080/wp-admin/" ],
      "testcookie": [ "1" ]
    }
  }
}
```

5 Javadoc

[org.forgerock.openig.filter.StaticRequestFilter](#)

SwitchFilter

SwitchFilter — divert exchange to other handler

1 Description

Conditionally diverts the exchange to another handler. If a condition evaluates to true, then the exchange is dispatched to the associated handler with no further processing by the switch filter.

2 Usage

```
{
  "name": string,
  "type": "SwitchFilter",
  "config": {
    "onRequest": [
      {
        "condition": expression,
        "handler": string,
      }, ...
    ],
    "onResponse": [
      {
        "condition": expression,
        "handler": string,
      }, ...
    ]
  }
}
```

3 Properties

"onRequest": *array of objects, optional*

Conditions to test (and handler to dispatch to, if true) before the exchange is handled.

"onResponse": *array of objects, optional*

Conditions to test (and handler to dispatch to, if true) after the exchange is handled.

"condition": *expression, optional*

Condition to evaluate to determine if exchange should be dispatched to handler. Default: unconditional dispatch to handler.

"handler": *string, required*

The name of the handler heap object to dispatch to if condition yields true.

4 Example

This example intercepts the response if it is equal to 200 and executes the `LoginRequestHandler`. This filter might be used in a login flow where the request for the login page must go through to the target, but the response should be intercepted in order to send the login form to the application. This is typical for scenarios where there is a hidden value or cookie returned in the login page which must be sent in the login form:

```
{
  "name": "SwitchFilter",
  "type": "SwitchFilter",
  "config": {
    "onResponse": [
      {
        "condition": "${exchange.response.status == 200}",
        "handler": "LoginRequestHandler"
      }
    ]
  }
}
```

5 Javadoc

[org.forgerock.openig.filter.SwitchFilter](#)

Miscellaneous Heap Objects

Table of Contents

ConsoleLogSink	65
TemporaryStorage	67

ConsoleLogSink

ConsoleLogSink — log to standard error

1 Description

A log sink that writes log entries to the standard error stream.

2 Usage

```
{
  "name": string,
  "type": "ConsoleLogSink",
  "config": {
    "level": string
  }
}
```

3 Properties

"level": string, optional

The level of log entries to display in the console. Must be one of: OFF, ERROR, WARNING, INFO, CONFIG, STAT, DEBUG, TRACE, ALL. Default: INFO.

4 Example

```
{
  "name": "LogSink",
  "comment": "Default sink for logging information.",
  "type": "ConsoleLogSink",
  "config": {
    "level": "DEBUG"
  }
}
```

5 Javadoc

[org.forgerock.openig.log.ConsoleLogSink](#)

[org.forgerock.openig.log.LogLevel](#)

TemporaryStorage

TemporaryStorage — cache streamed content

1 Description

Allocates temporary buffers for caching streamed content during request processing. Initially uses memory; when the memory limit is exceeded, switches to a temporary file.

2 Usage

```
{
  "name": string,
  "type": "TemporaryStorage",
  "config": {
    "initialLength": number,
    "memoryLimit": number,
    "fileLimit": number,
    "directory": string
  }
}
```

3 Properties

"initialLength": *number, optional*

The initial length of memory buffer byte array. Default: 8192 (8 KiB).

"memoryLimit": *number, optional*

The length limit of the memory buffer. Exceeding this limit results in promotion from memory to file. Default: 65536 (64 KiB).

"fileLimit": *number, optional*

The length limit of the file buffer. Exceeding this limit results in a thrown exception. Default: 1048576 (1 MiB).

"directory": *string, optional*

The directory where temporary files are created. If omitted, then the system-dependent default temporary directory is used (typically "/tmp" on Unix systems). Default: use system-dependent default.

4 Javadoc

[org.forgerock.openig.io.TemporaryStorage](https://org.forgerock.openig.io/TemporaryStorage)

Expressions

Many configuration parameters support dynamic expressions.

Table of Contents

Expressions	71
Functions	75
Patterns	81

Expressions

Expressions — expression configuration parameter values

1 Description

Expressions are specified as configuration parameter values for a number of built-in objects. Such expressions conform to the Universal Expression Language as specified in [JSR-245](#).

2 General Syntax

All expressions follow standard Universal Expression Language syntax: `${expression}`. The expression can be a simple reference to a value, a function call, and/or arbitrarily complex arithmetic, logical, relational and conditional operations. When supplied within a configuration parameter, an expression is always a string enclosed in quotation marks, for example: `"${exchange.request.method}"`.

3 Value Expressions

A value expression references a value relative to the scope supplied to the expression. In the current version of the gateway, the supplied scope is always the HTTP [exchange object](#). For example `"${exchange.request.method}"` references the method of an incoming HTTP request in the exchange scope. A *lvalue-expression* is a specific type of value expression, which references a value to be written. For example, `"${exchange.session.gotoURL}"` specifies a session attribute named `gotoURL` to write a value to. Attempts to write values to read-only values are ignored.

4 Indexed Properties

Properties of values are accessed using the `.` and `[]` operators, and can be nested arbitrarily. The value expressions `"${exchange.request}"` and `"${exchange['request']}"` are equivalent. In the case of arrays, the index of an element in the array is expressed as a number in brackets, for example `"${exchange.request.headers['Content-Type'][0]}"` references the first Content-Type header value in a request. If a property does not exist, then the index reference yields a `null` (empty) value.

5 Operations

Universal Expression Language supports arbitrarily complex arithmetic, logical, relational and conditional operations. They are, in order of precedence:

- Index property value: [], .
- Change precedence of operation: ()
- Unary negative: -
- Logical operations: not, !, empty
- Arithmetic operations: *, /, div, %, mod
- Binary arithmetic operations: +, -
- Relational operations: <, >, <=, >=, lt, gt, le, ge, ==, !=, eq, ne
- Logical operations: &&, and, ||, or
- Conditional operations: ?, :

6 Functions

A number of [built-in functions](#) can be called within an expression. Syntax is `${function(param, ...)}`, where zero or more parameters are supplied to the function. For example, `"${toLowerCase(exchange.request.method)}"` yields the method of the request, converted to lower case. Functions can be operands for operations, and can yield parameters for other function calls.

7 Examples

Lines are folded for readability in these example. In your JSON, keep the values on one line.

```
"${exchange.request.uri.path == '/wordpress/wp-login.php' and
exchange.request.form['action'][0] != 'logout'}"

"${exchange.request.uri.host 'wiki.example.com'}"

"${exchange.request.cookies[keyMatch(exchange.request.cookies, '^SESS.*')][0]
.value}"

"${toString(exchange.request.uri)}"

"${exchange.request.uri.value}"

"${exchange.request.method 'POST' and exchange.request.uri.path
'/wordpress/wp-login.php'}"

"${exchange.request.method 'GET'}"

"${exchange.request.headers['cookie'][0]}"

"${exchange.request.uri.scheme 'http'}"
```

```
"${not (exchange.response.status 302 and not empty exchange.session.gotoURL)}"  
"${exchange.response.headers['Set-Cookie']}[0]}"  
"${exchange.request.headers['host']}[0]}"
```

8 See Also

[Exchange](#)

[Functions](#)

Functions

Functions — built-in functions to call within expressions

1 Description

A set of built-in functions that can be called from within [expressions](#).

2 contains

```
contains(object, value)
```

Returns `true` if the object contains the specified value. If the object is a string, a substring is searched for the value. If the object is a collection or array, its elements are searched for the value.

Parameters

`object`
the object to be searched for the presence of.

`value`
the value to be searched for.

Returns

`true`
if the object contains the specified value.

3 indexOf

```
indexOf(string, substring)
```

Returns the index within a string of the first occurrence of a specified substring.

Parameters

`string`
the string to be searched.

`substring`
the value to search for within the string.

Returns

the index of the first instance of substring, or -1 if not found.

4 join

```
join(strings, separator)
```

Joins an array of strings into a single string value, with a specified separator.

Parameters

separator

the separator to place between joined elements.

strings

the array of strings to be joined.

Returns

the string containing the joined strings.

5 keyMatch

```
keyMatch(map, pattern)
```

Returns the first key found in a map that matches the specified [regular expression pattern](#), or null if no such match is found.

Parameters

map

the map whose keys are to be searched.

pattern

a string containing the regular expression pattern to match.

Returns

the first matching key, or null if no match found.

6 length

```
length(object)
```

Returns the number of items in a collection, or the number of characters in a string.

Parameters

object

the object whose length is to be determined.

Returns

the length of the object, or 0 if length could not be determined.

7 matches

```
matches(string, pattern)
```

Returns an array of matching groups for a [regular expression pattern](#) against a string, or null if no such match is found. The first element of the array is the entire match, and each subsequent element correlates to any capture group specified within the regular expression.

Parameters

string

the string to be searched.

pattern

a string containing the regular expression pattern to match.

Returns

an array of matching groups, or null if no such match is found.

8 **split**

```
split(string, pattern)
```

Splits a string into an array of substrings around matches of the given [regular expression pattern](#).

Parameters

string
the string to be split.

pattern
the regular expression to split substrings around.

Returns

the resulting array of split substrings.

9 **toLowerCase**

```
toLowerCase(string)
```

Converts all of the characters in a string to lower case.

Parameters

string
the string whose characters are to be converted.

Returns

the string with characters converted to lower case.

10 **toString**

```
toString(object)
```

Returns the string value of an arbitrary object.

Parameters

object
the object whose string value is to be returned.

Returns

the string value of the object.

11 **toUpperCase**

```
toUpperCase(string)
```

Converts all of the characters in a string to upper case.

Parameters

string
the string whose characters are to be converted.

Returns

the string with characters converted to upper case.

12 **trim**

```
trim(string)
```

Returns a copy of a string with leading and trailing whitespace omitted.

Parameters

string
the string whose white space is to be omitted.

Returns

the string with leading and trailing white space omitted.

Patterns

Patterns — regular expression patterns

1 Description

Patterns in configuration parameters and expressions use the standard Java regular expression [Pattern](#) class. For more information on regular expressions, see Oracle's [tutorial on Regular Expressions](#).

2 Pattern Templates

A regular expression pattern template expresses a transformation to be applied for a matching regular expression pattern. It may contain references to [capturing groups](#) within the match result. Each occurrence of `$g` (where *g* is an integer value) is substituted by the indexed capturing group in a match result. Capturing group zero "`$0`" denotes the entire pattern match. A dollar sign or numeral literal immediately following a capture group reference can be included as a literal in the template by preceding it with a backslash (`\`). Backslash itself must be also escaped in this manner.

Exchange Object Model

Expressions are evaluated within an exchange object model scope.

Table of Contents

Exchange	85
Request	87
Principal	89
Response	91
URI	93

Exchange

Exchange — HTTP exchange of request and response

1 Description

The root object for the exchange object model: an HTTP exchange of request and response. The exchange object model parallels the document object model, exposing elements of the exchange. It supports this by exposing a set of fixed properties and allowing arbitrary properties to be added.

2 Properties

"exchange": *object*

Self-referential property to make this the root object in the exchange object model.

"request": *object*

The request portion of the HTTP exchange.

"response": *object*

The response portion of the HTTP exchange.

"principal": *object*

The principal associated with the request, or null if unknown.

"session": *object*

Session context associated with the remote client. Exposes session attributes as name-value pairs, where both name and value are strings.

3 Javadoc

[org.forgerock.openig.http.Exchange](#)

Request

Request — HTTP exchange request

1 Description

An HTTP request message in an exchange object model.

2 Properties

"method": *string*

The method to be performed on the resource. Example: "GET".

"uri": *object*

The fully-qualified URI of the resource being accessed. Example: "http://www.example.com/resource.txt".

"version": *string*

Protocol version. Example: "HTTP/1.1".

"headers": *object*

Exposes message header fields as name-value pairs, where name is header name and value is an array of header values.

"cookies": *object*

Exposes incoming request cookies as name-value pairs, where name is cookie name and value is an array of string cookie values.

"form": *object*

Exposes query parameters and/or application/x-www-form-urlencoded entity as name-value pairs, where name is the field name and value is an array of string values.

"entity": *object*

The message entity body (no accessible properties).

3 Javadoc

[org.forgerock.openig.http.Request](#)

Principal

Principal — user principal in HTTP exchange

1 Description

Represents a user principal in an exchange object model, containing the name of the current authenticated user.

2 Properties

"name": *string*

The name of the principal, or null if principal is undefined (user has not been authenticated).

3 Javadoc

[java.security.Principal](#)

Response

Response — HTTP exchange response

1 Description

An HTTP response message in an exchange object model.

2 Properties

"status": *number*

The response status code. Example: 200.

"reason": *string*

The response status reason. Example: "OK".

"version": *string*

Protocol version. Example: "HTTP/1.1".

"headers": *object*

Exposes message header fields as name-value pairs, where name is header name and value is an array of header values.

"entity": *object*

The message entity body (no accessible properties).

3 Javadoc

[org.forgerock.openig.http.Response](#)

URI

URI — Uniform Resource Identifier in HTTP exchange

1 Description

Represents a Uniform Resource Identifier (URI) reference in an exchange object model. URI properties are read-only.

2 Properties

"scheme": *string*

The scheme component of the URI, or null if the scheme is undefined.

"schemeSpecificPart": *string*

The decoded scheme-specific part of the URI, never null.

"authority": *string*

The decoded authority component of the URI, or null if the authority is undefined.

"userInfo": *string*

The decoded user-information component of the URI, or null if the user information is undefined.

"host": *string*

The host component of the URI, or null if the host is undefined.

"port": *number*

The port component of the URI, or null if the port is undefined.

"path": *string*

The decoded path component of the URI, or null if the path is undefined.

"query": *string*

The decoded query component of the URI, or null if the query is undefined.

"fragment": *string*

The decoded fragment component of the URI, or null if the fragment is undefined.
